

Andi:

- Potentially add some sort of indicator to know which page you are on in the navigation bar.
- Remove the links from the nav bar that do not work.
- The cider finder/search function is simple to use and understand.
- The primary problem with the cider finder is that many options do not yield results; maybe the options that are not available for each selection can be grayed out.
- The website overall feels clean and clearly laid out.
- Can a message be displayed after the search button is hit that indicates that the results are below?

Vibhasa:

- Really liked how the scroll feature worked at smaller screen sizes.
- The slight “pop” of the cider cards when you hover over them with the mouse is a really nice touch of user feedback.
- The cider finder/search function is simple and easy to understand. A better route than the earlier intention of a branching quiz allows for broader searches.
- Maybe a short description can be given about each search box so people who are not familiar with ciders can understand what each search is for.
- The display of “Sorry, no search results found” makes sense to display when results are not found.
- Did not find the Sorry message within the cider finder to be particularly disruptive or irritating.
- Liked the drop-down about accordions in the cider cards.
- Probably wouldn’t have noticed the scroll functionality if the desktop version of the site had not been seen before the mobile version.

Sara:

- Found it difficult to identify that the cards could scroll on mobile.
- Thought that not all the ciders were displayed because the scroll feature was not visible on mobile.
- Generally confused about why certain navigation buttons, such as events and visit, were not working until given the explanation that those pages do not exist.
- In the first implementation of the cider finder selections, the reset button seemed unnecessary because each new search would wipe previous results anyway.
- In the second implementation of the finder, where options that would yield no results were greyed out, the result button should be brought back to make resetting search terms easier.
- This second implementation of the finder with greyed out options made it better because you know you can’t select something with no results.
- Struggled to navigate the select options manually when going back and forth between search options for each select. This could be fixed by a reset button.

Chuck:

- Confused as to why some options were greyed out in each selection. "It's not letting me restart. Did you gray out non-options?"
- Thought that the different selects needed to be chosen in a specific order.
- Not aware that certain card groups could scroll horizontally
- Can the scroll bar just be made permanently visible?
- Agreed that the reset button would make resetting search terms easier.
- Agreed that adding some detail above the finder about how it works would help.
- Thought there should be some indicator that search results would show up below the cider finder.
- Confirmed that card scrolling was working properly after another user identified that the card scrolling was broken and would only scroll between 2 cards, even if there were more.

Amelia:

- Liked that when one about section was expanded that the first of the cards in that group also grew to the same height. Thought it might look weird if they didn't.
- The cider finder/search function was easy to understand and use.
- Really liked the detail of hover effects on all the cards.
- Really enjoyed clicking on the expanding accordion buttons in the cards. Enjoyed that aspect of interactivity.
- Identified a strange issue with the card scrolling on Safari on a mobile device, where card scrolling was broken and would only scroll between 2 cards, even if there were more. This issue was tested by other users on the same device brand and browser, and the issue could not be replicated.
